HEMA PREDVRTAVANJA - centralna vrtina
FOREBORING SCHEME - central borehole

OPOMBE:

- Izvedba centralne vrtine se izvede za potrebe:
 - redne geološko-geomehanske in hidrogeološke spremljave, ki se izvaja tekom gradnje predora
 - ugotavljanja prehoda skozi različne litološke enote
 - zaznavanja kraških pojavov
 - izvedbo georadarskih preiskav (refleksijska metoda)
- Centralna vrtina se uporablja na območjih nizke, srednje in visoke zakrasedlosti kot prva stopnja zaznavanja kraških pojavov.
- Izvedba centralne vrtine v dolžini do 100 m z naklonom navzgor 1° ter premera 144/114 mm po tehnologiji z udarnim rotacijskim vrtnjem in začasnim cevjenjem (obložna kolona) vrtine.
- Najprej se vgradi uvodna kolona. Vrtina 222 mm, dolžine največ 6m s cevjenjem (dolžina je odvisna od prepustnosti hribine in višine vodnega stolpca).
- Za izvedbo vrtine mora biti vrtna garnitura opremljena z data loggerjem, kjer se spremlja hitrost in pritisk vrtnja.
- Vrtina se štiti s PVC perforirano cevjo notranjega premera (ID) vsaj 60 mm (cev zagotovi geotehnični inženir).
- Faznost izvedbe:
 - izvedba nastavka vrtine Ø222 mm v dolžini 6 m,
 - vgradnja uvodne kolone, cementiranje in preventorja,
 - izvedba vrtine 144/114 mm do končne dolžine
 - vstavev/vgradnja zaščitne PVC cevi
 - izvedba georadarskih preiskav
 - vgradnja opreme in izvedba hidrogeoloških raziskav.
- Shema predvrtavanja se uporablja za drenažo in nedrenirane odseke predora.

NOTES:

- The implementation of a central borehole shall be carried out for the purposes of:
 - regular geological-geomechanical and hydrogeological accompaniment performing during the construction of tunnel
 - determining the passage through different lithological units
 - perception of karst phenomena
 - performing georadar (reflection method)
- The central borehole is used in areas of low, medium and high karstification as the first stage of detection of detection of karst phenomena.
- Implementation of a central borehole up to a length of 100 m with an upward inclination of 1 ° and a diameter of 144/114 mm according to the technology with percussive rotary drilling and temporary tubing (casing column) of the borehole.
- The introductory column is installed first. Drill 222 mm, length up to 6 m with tubing (length depends on permeability and ground water level).
- To drill a hole, the drilling rig must be equipped with a data logger, where the drilling speed and pressure are monitored..
- The borehole shall be protected by a PVC perforated tube of internal diameter (ID) of at least 60 mm (pipe is supplied by geotechnical engineer).
- Phase of implementation:
 - implementation of a borehole Ø222 mm in length 6 m,
 - installation of the introductory column, cementation and preventer,
 - implementation of a hole 144/114 mm to the final length
 - insertion / installation of protective PVC pipe
 - performing georadar surveys
 - Installation of equipment and implementation of hydrogeological research.
- The pre-drilling scheme applies to drained and undrained sections of the tunnel.
